It is a mistake to think that one can learn anatomy through studying parts. We focus on single parts for years and perhaps even decades, learning details, remembering features and recognizing them. We also learn about the interaction of these parts and their functions, as well as their position and relationship with other parts. It is only when we then put all of this knowledge together—all these years of learning parts—that we can begin to see the whole. But when we do, we cannot just see the whole. We cannot see the whole because we are learning "parts"—anatomy. We are analyzing and describing in order to be able to learn, to understand and to connect. We are linking parts and using them to describe the whole. But the emphasis needs to be on linking, not describing, because as soon as we are describing, we are learning. As soon as we begin to learn parts and not see the whole, that is when we stop being able to learn anatomy. I have seen lots of people try to learn anatomy by studying parts. But when they get to the point that they stop learning, that is when they stop being able to learn anatomy. This is why I want to emphasize again: it is a mistake to think that one can learn anatomy through studying parts. When I was in my early years of study, I studied anatomy in the sense that I would see a muscle and study it, which I know is a very common way of studying anatomy. I then would try to describe it to myself in my own language. I would try to think about the function of this muscle. I would try to think about its place. I would try to think about what other

This invention relates to the field of automated control of mechanical devices and, more particularly, to the field of autonomous vehicle control. It is known to provide a moving vehicular robot having a vehicle body and a movable arm for manipulating one or more devices. The robot is, for example, a self-propelled wheelchair and may be programmed to perform certain tasks, such as cleaning a room or assistance with a nursing task. It is known to program or tailor the mobility of a robot to the desired degree of assistance. For example, a robot may perform a given task so that the robot can only wander from the immediate vicinity of an object or a user, traverse only a specific area, stand in a particular location, or the like. The present invention provides an improved control system for such a robot or other autonomous mechanical device. In accordance with the invention, a robot or other mechanical device is provided with an attitude reference sensor. The sensor is arranged to provide an output indicative of the instantaneous attitude of the device. In accordance with a preferred embodiment, the sensor is disposed to provide a three-dimensional output which forms a single, continuous vector. A control means may then be coupled to the output of the attitude sensor to control the behavior of the robot in accordance with the output from the sensor. As a result, the behavior of the robot is governed by attitude as opposed to position, thereby improving the control system. In a further embodiment of the invention, the attitude sensor is arranged to provide three outputs indicative of the instantaneous attitude of the device in three respective axes. The control means then performs

three respective control operations to control the behavior of the robot in accordance with the three outputs. The three outputs may be a three-dimensional vector, such that the control means controls robot motion in the three axes in accordance with the three vector components. A particularly advantageous embodiment of the invention is one in which the attitude reference sensor is arranged to provide two attitude outputs with one being indicative of an axis of the device about which

... The stand-alone application enables users to put together and compile their own Code snippets and post their Source Code on PASTEBIN for others to use and learn from. This is quite useful and I've tried it but couldn't really figure out how to use it. I'd imagine it's great for programmers and people who like to write code on the go. However, there were also a few things that made it hard for me to figure out how to use, such as: - syntax highlighting is not implemented - line numbers for the document are not implemented - no plugin support I've used WhiteSnake Editor before and I've always really liked it, but now it has some major flaws that make it not as convenient to use. Even though I used it before, it's not really like I'm going to use it now. This is mainly because it seems like it has completely changed. If it was pre-3.1 I would have just upgraded, but it's new, new, new so it's hard to get back. I really want it to be new, new, new but it just doesn't work for me. Hey guys, I am trying to convert my WISE editor export into.txt format because my ISP blocks apps with more than 2MB. I think WhiteSnake Editor is about 1.8MB but I don't know for sure. The txt export does not work at all. Is there any way of converting it into.txt format? The download links now go to the site A: You can export a code as plain text with one of the export plugins that is built in (JSON, XML, NUT) or load it into a text editor such as Notepad++, BBEdit, Cyberduck, etc. When you want to export to.txt, save as to NUT format (export, save as and select NUT). This is a screenshot of how.NUT looks. You can also export to XML and you can use Firefox add-on to open.txt files and then select the export to Text from the context menu. For more information, see the WhiteSnake Editor help: How to Export
